Absolute Configuration

Glycolipids of bacterial origin which are homologous mixts. varying with the origin of the sample. On pyrol. they yield $RCHO + R'CH_2COOH$. R' is a saturated alkyl residue. R may be saturated or unsaturated. The following classes have been recognised. (i) From *Corynebacterium diphtheriae* and *Nocardia opaca*: $R = C_{15}$; $R' = C_{14}$ $R = n-C_{31}$, $n-C_{33}$, $n-C_{35}$; $R' = C_8$, C_{10} , C_{12} (ii) Acids containing unsaturated alkyl chains (and in some cases branching methyl groups) from *C. diphtheriae*, *N. spp.* and *Mycobacterium smegmatis*: $R = 8$ -pentadecenyl; $R' = C_{14}H_{29}$ $R = C_{37}$, C_{39} , C_{41} ; $R' = C_{22}H_{45}$ also dienes, $R = C_{49}H_{95}-C_{58}H_{113}$ (10 members), some of which have a branching methyl group. (iii) Acids containing one cyclopropane unit, one double bond and one branching methyl, from *M. smegmatis*: e.g. $R = H_3C(CH_2)_{17}$ -cyclopropyl- $(CH_2)_{13}CH=CHCH(CH_3)$; $R' = C_{22}H_{45}$ (iv) Acids containing two cyclopropane units from *M. tuberculosis* and *M. paratuberculosis*. (v) Acids with additional oxygenated functions

(-OMe, C=O and -COOH) in R': e.g. R' = H₃C(CH₂)₁₇CH(CH₃)CO(CH₂)₁₆-cyclopropyl-(CH₂)₁₉; R = C₂₄H₄₉ R' = HOOC(CH₂)_xCH=CH(CH₂)_y-(x = 14, 16; y = 17, 19); R = C₂₀, C₂₂, C₂₄ R' = HOOC(CH₂)₁₄CH(CH₃)CH=CH(CH₂)₁₆; R = C₂₀, C₂₂, C₂₄.

Nucleic acid

N-83

General term describing natural macromolecules found in living cells formed by the polymerisation of mixed nucleotides. There are two main types: Deoxyribonucleic acid, D-361 which usually has a very high molecular weight, particularly that present in bacterial and animal cells, and Ribonucleic acid, R-130 which has lower molecular weights. RNA is a polymer of ribonucleotides derived mainly from Adenine, Cytosine, Guanine and Uracil, linked by 3',5'-phosphodiester bonds, whereas DNA consists of similar polymers, but of deoxyribonucleotides, derived mainly from Adenine, Guanine and Cytosine, as in RNA, but with Thymine in place of Uracil.

Pectic acid

P-14

Pectinic acid, Pectin
[9046-40-6]

Colloidal polygalacturonic acids which are essentially completely deesterified and with varying degrees of neutralisation are referred to as pectic acids. Pectinic acids are colloidal polygalacturonic acids with more than a negligible content of Me ester groups with varying degrees of neutralisation. The term pectins refers to those water-soluble pectinic acids of varying Me ester content and degree of neutralisation that are capable of forming gels with sugar and acid under suitable conditions. In pectins, the α-(1→4)-linked D-polygalacturonate sequences are interrupted with (1→2)-L-rhamnose residues, neutral sugars, e.g. D-galactose and L-arabinose, form side chains on the pectin molecules. The mol. wt. of pectins is 20,000 - 400,000. Present in cell walls of all plant tissues. Up to 30% w/w can be isol. from orange and lemon rind. Pectic gels contg. cations, esp. Ca²⁺, are important components of higher plant cell walls and are also important components of commercial pectin products. Used in food processing as a gelling agent, stabiliser, thickener and emulsifier.

(3R,4R)-form

C₁₇H₂₀N₄O₃ 328.37

Formed from aldopentoses by treatment with phenylhydrazine. The reaction involves a formal oxidation step involving destruction of the chiral centre at C-2. The four (enantiomeric pairs of) pentoses therefore form a total of two different osazones. In addition, the two 2-pentuloses form the same osazones by formal oxidation at C-1. Key compds. for historical characterisation of pentoses and their configurational interconversion. Readily converted to osotriazoles which were used for further characterisation.

Peptidoglycan P-50

Murein. Mucopeptide. Glycopeptide

Consists of linear polysaccharide chains cross-linked by oligopeptide units to form a single bag-shaped giant molecule which envelops the cytoplasmic membrane of bacterial cells. Gram-negative bacterial cell walls contain a thin layer of peptidoglycan whereas it is the major component of gram-positive bacterial cell walls. Detailed studies have been made on the peptidoglycan isolated from cell walls of *Micrococcus luteus*, *Staphylococcus aureus* and *E. coli*.

Psyllium hemicellulose, P-109

USAN

Hemicellulose, 9CI. Masonex

[9034-32-6]

Consists of a combination of highly subst. arabinoxylan polysaccharides. These polysaccharides are linear chains of xylose units to which are attached single units of arabinose and additional xylose. Also present are rhamnose, galactose, glucose and rhamnosyluronic acid residues. Alkali sol. fraction of psyllium (*Plantago ovata*) seed husk. Laxative and cholesterol lowering agent. Source of dietary fibre.

Quinic acid

Q-10

1,3,4,5-Tetrahydroxycyclohexanecarboxylic acid, 9CI. Hexahydro-1,3,4,5-tetrahydroxybenzoic acid. Chincic acid

[36413-60-2]

(-)-form

C₇H₁₂O₆ 192.168

Note that the C atom carrying the OH which is *cis* to the COOH is normally numbered 3. Care is needed; see Eliel (1997). CA numbers the OH *cis* to the COOH, 5.

(+)-form [7216-27-5]

Mp 164°. [α]_D²⁰ +44 (H₂O).

(-)-form [77-95-2]

Occurs in cinchona bark, coffee beans, tobacco leaves and many other plant sources. Food acidulant with good taste characteristics, use limited by cost. Sol. H₂O.

Mp 162-163°. [α]_D²⁶ -42.1 (H₂O). pK_a 3.58 (25°).

Rhamnogalacturonan I**R-9**

Polysaccharide consisting of (\rightarrow 4)- α -D-GalpA-(1 \rightarrow 2)- α -L-Rhap-(1 \rightarrow) backbone with arabinan and oligogalactosyl side-groups attached at O-4 of the Rha residues. Interspecies variation is prob. due to side-chain variation. Isol. from xylem-differentiating zones of *Cryptomeria japonica* and from sycamore (*Acer pseudoplatanus*). Major pectic polysaccharide component of cell walls of dicots and nongraminaceous monocots.

Small complex polysaccharide containing apiose, 2-O-methyl-L-fucose, 2-O-methyl-D-xylose, aceric acid, Penta-Ac, 3-deoxy-D-lyxo-heptulosaric acid and other sugars depending on source. Obt. by the action of liquefying enzymes on apple, tomato and carrot juice pectin. The main nondegraded soluble polysaccharide component of the juice. Also present in various other plant products, e.g. leaves of *Panax ginseng* (ginseng).

C₈H₁₂N₄O₅ 244.207

Antiviral agent. Usually administered as an aerosol. As Ribetron, in combination with Interferon Alfa 2b, used for the treatment of malignant melanoma, Kaposi's sarcoma, warts, hairy cell leukaemia, hepatitis B and C and non-Hodgkin's lymphoma. Marketed drug. Approved for clinical use in the EU (1999). Approved by FDA (July 2003) for treatment of pediatric hepatitis CSol. H₂O. Mp 174-176°. [α]_D²⁵ -36.5. Log P -3.58 (calc). Analogue of Tiazofurine, T-114.

Ribonucleic acid, 9CI, 8CI**R-130****RNA**

Polynucleotide of Adenosine, Guanosine, Cytidine, Uridine and some minor nucleosides linked by phosphate diester bonds from the 3'-hydroxyl of one D-ribose to the 5'-hydroxyl of the next. There are several types of RNA. Ribosomal RNA (rRNA) is a metabolically stable form comprising 80% of DNA in cells and it is an important component of ribosomes. Two high molecular weight (ca. 10^6) spp. have been isol. from bacterial cells and at least one sp. of low molecular weight has been identified. Messenger RNA (mRNA) is a short-lived high molecular weight material which is complementary to one strand of DNA. It acts as a template for protein synthesis in the cell. Transfer RNA (tRNA) is a low molecular weight ($23\text{--}28 \times 10^3$) polymer containing 75-90 nucleotides. Each tRNA is specific for one amino acid and during protein synthesis it binds the amino acid, locates the relevant codon on mRNA, places the amino acid correctly for attachment in the growing polypeptide chain and binds the polypeptide to the ribosome.

ent-form

Readily synthesised from D-glucose. Recommended as a superior material for non-biochemical studies on RNA props.

Sialic acids**S-37**

Nonulosaminic acid. Neuraminic acids

A family of acylated amino nonulosonic acids of which Neuraminic acid, N-35 is the parent. They are widely distributed throughout the animal kingdom in mucopolysaccharides, mucoproteins and lipolysaccharides (mucolipids), mostly in association with 2-Amino-2-deoxyglucose, A-266 and 2-Amino-2-deoxygalactose, A-206. Involved in receptor recognition, cell adhesion, aggregation, antigenicity masking, metastatic potential, nerve-signal transmission, viral replication and some genetic disorders.

[9005-25-8]

Starch is composed of Amylose and Amylopectin. Amylose is preponderantly a linear polymer of several thousand D-glucose units mainly α -(1 \rightarrow 4) linked. Amylopectin is a branched polymer composed largely of α -D-(1 \rightarrow 4)-linked glucose units. The branch is α -(1 \rightarrow 6) and occurs at the 6 position every 20-25 glucose units. Pullulanase, R-enzyme and Isoamylase hydrol. the α -D-(1 \rightarrow 6) linkages. Polymeric. Minimum formula given. Graft polymers with acrylates are used as water-absorbent resins.

- Phosphate:** [11120-02-8] [39373-98-3] Industrial material with various uses depending on level of phosphorylation. Used in food processing. Many different structs. are present at different phosphorylation levels.

Carboxymethyl ether: [9057-06-1] Modified starch used as thickening agent in food industry and pharmaceuticals. Powder.

2-Hydroxyethyl ether: Pentastarch [9005-27-0] Modified starch used as sizing agent in textile industry. Used in artificial blood.

2-Hydroxypropyl ether: [9049-76-7] Modified starch used as sizing agent and adhesive.

Oxiranylmethyl ether: Amilomer, INN. Starch-epichlorohydrin ether. 2,3-Epoxypropyl starch. Spherex [42615-49-6] Chemoembolisation agent. No phys. props. reported. Spherical particles prep. by crosslinking partially hydrolysed potato starch using epichlorohydrin as a cross-linking agent.

Unbranched-form**Amylose**

[9005-82-7]

Stored in all parts of plants as insol. granules. Coml. starches come mainly

from corn (maize), sorghum grains, tapioca root and potato tuber. Most starch samples contain $20 \pm 5\%$ Amylose which can be pptd. from aq. starch soln. with, e.g., Thymol. Used in particulate form as a dusting powder, as a gelling agent in processed foods, as a flocculant and pigment retainer in paper manuf. and in dried film form for sizing paper and textiles. Used in photometric detn. of I₂; as an indicator in iodometry. Pharmaceutical aid and excipient (binder, diluent and disintegrant). $[\alpha]_D^{+200}$ (H₂O). $[\alpha]_D^{+162}$ (1M NaOH). $[\alpha]_D^{+175}$ (DMSO). Hydrol. by acid, α -Amylase and β -Amylase. Forms inclusion complexes, gives a deep-blue colour with I₂. Four polymorphs (A,B,C and V amyloses) have been studied structurally and differ in helical conformation and packing.

Per-Ac:

[9045-28-7] Many uses in food processing. $[\alpha]_D^{+175}$ (CHCl₃).

Percarbanilate: $[\alpha]_D^{+82.5}$ (Py).

Branched-form Amylopectin

[9037-22-3]

$[\alpha]_D^{+200}$ (H₂O). $[\alpha]_D^{+163}$ (1M NaOH).

Per-Ac:

[9045-28-7] $[\alpha]_D^{+170}$ (CHCl₃).

Percarbanilate: $[\alpha]_D^{+62}$ (Py).

Sulfated form: Amylopectin sulfate

Sulfated form, Na salt: Sodium amylosulfate, USAN. Depepsen [9010-01-9] Enzyme inhibitor.

Sucrose

β -D-Fructofuranosyl α -D-glucopyranoside, 9CI, 8CI. *Saccharose*. *Cane sugar*. *Beet sugar*

[57-50-1]

C₁₂H₂₂O₁₁ 342.299

Widespread in seeds, leaves, fruits, flowers and roots of plants, where it functions as an energy store for metabolism and as a carbon source for biosynth. Annual world production is in excess of 90 \times 10⁶ tons mainly from the juice of sugar cane and sugar beet which contain respectively ca. 20% and ca. 17% of the sugar. Sweetening agent and food source assimilated by most organisms. Also used in food products as a preservative, antioxidant, moisture control agent, stabiliser and thickening agent. Reference material used in elemental microanalysis. Cryst. (H₂O or EtOH). Mp 185-187°. [α]_D +66.5 (H₂O). Log P -5.72 (uncertain value) (calc). Does not reduce Fehling's soln., form an osazone or mutarotate. Hydrol. with invertase or acid gives D-glucose and D-fructose.

► OES long-term 10 mg m⁻³, short-term 20 mg m⁻³. LD₅₀ (rat, orl) 29700 mg/kg. Exp. teratogen (very large doses). WN6500000 *Biosynthetic intermed. to sucrose*

Tannic acid. Gallotannic acid. Gallotannin.

Chinese tannin. Glycerite. FEMA 3042

[1401-55-4]

Chinese gallotannin is a mixt. of isomers and closely related compounds whose average composition corresponds to that of Penta-*O*-(*m*-digalloyl)- β -D-glucose. There are also some trigalloyl units. See also individual entries for separately characterised tannin components. A major constit. of galls of many spp. of oak (e.g. *Quercus lusitanica*), the leaves of Stagshorn (*Rhus typhina*) and pods of tara (*Caesalpinia spinosa*). Used as a mordant in dyeing, ink manuf., tanning, clarifying beer and wine and photography and as a coagulant in rubber manuf. Can be used as an astringent. Used as 3% aq. soln. for gravimetric detn. of Nb, Ta, Ti, U, W; separation of Ta and Nb. Astringent. Yellowish powder. Sol. H₂O, EtOH, Me₂CO; sl. sol. Et₂O. Mp 210-215° dec. $[\alpha]_D^{20} +12 \rightarrow +18.4$ (c, 2 in Me₂CO) (from Chinese galls, Sicilian sumach or Stagshorn sumach). $[\alpha]_D^{20} +21.7 \rightarrow +23.2$ (c, 2 in Me₂CO) (from Turkish galls). Forms precipitates with metal salts, alkaloids, albumen and gelatin.

(2*R*,3*R*)-form

L-form. *L*-Threarcic acid. FEMA 3044. E334 [87-69-4] [526-83-0] Occurs in many plants and fruit. Coml. available from the KH salt deposited in fermenting grape juice. Acidulant for beverages, foods and pharmaceuticals, firming agent, flavour enhancer, humectant, other uses in food. Used to clean metals for plating, as a mordant for dyeing and in calico printing.

Resolving agent for bases. Monomer used in biodegradable polyesters and polyurethanes useful as controlled release agents. Used as a masking agent for metals; gravimetric detn. of K; KH-tartrate is used as primary alkalimetric standard. The acid and many of its derivs. are inexpensive resolving agents for chiral bases. Monomer for optically active polyamides. Pharmaceutical aid (buffering agent). Mp 169-170°. $[\alpha]_D^{20} +12$ (c, 20.0 in H₂O). p*K*_{a1} 2.98; p*K*_{a2} 4.34 (25°). Log P -3.27 (calc).

Teichoic acid T-14

[9041-38-7]

Teichoic acids are polymers of glycerol or ribitol phosphate in which some of the free hydroxyl groups may be glycosylated or esterified with D-alanine. Prominent constituents (along with peptidoglycan and other heteropolysaccharides) of the cell walls or envelopes which surround the cytoplasmic membrane of gram-positive bacteria cells. There are two major classes; those which occur in the wall, covalently linked to the peptidoglycan, and those known as lipoteichoic acids, which are situated on the surface of the cytoplasmic membrane and are covalently linked to the glycolipid located within the membrane. The former class of polymers contain glycerol and ribitol phosphates (I and II) and they comprise a major part of the purified cell walls (30-50%). The lipoteichoic acids are formed exclusively from glycerol phosphate (I); see separate entry Lipoteichoic acids, L-45.

Ukonans

Neutral polysaccharides. Consts. of the rhizomes of *Curcuma longa* (turmeric). Show activity towards the reticuloendothelial system. Immunostimulant and phagocytosis-activating agents.

Ukonan A [128606-57-5]

Powder. $[\alpha]_D^{25}$ -16.7 (c, 0.1 in H₂O).

Ukonan B [128606-58-6]

Powder. $[\alpha]_D^{25}$ -40 (c, 0.1 in H₂O).

Ukonan C [128606-59-7]

Powder. $[\alpha]_D^{25}$ +37.3 (c, 0.1 in H₂O).

Ukonan D [141490-48-4]

Powder. $[\alpha]_D^{23}$ +81.7 (c, 0.1 in H₂O). Also contains a small amount of a peptide moiety.
